

Passport Issuance by Fiscal Year

This dataset consists of 336 records detailing the number of passports issued within a year in a particular state. The data spans from 2007 to 2012.

Each record contains 4 fields (as above), and are stored as either a Number or a String. The root of the dataset is an array, ordered by year and then by state.

Considering the dataset as a tree, it's structure is shallow, but it contains many branches at the same depth. This makes getting information such as averages straightforward, with no need for recursion.

In terms of the data being rendered as XML, all the data elements will be groups of 4, and will all be siblings to each other.
